MG SERIES

PEDL9008

PRODUCT DETAILS

Incorporating Marshall's very own patent-pending Stompware technology, developed from the award-winning JVM Series, the MG footcontroller makes using the MG "FX" amplifiers simplicity itself. The MG footcontroller is totally programmable, with each of the four footswitches assignable to any front panel switch, preset channel and/or built-in Tuner. A simple LED panel lets you know exactly what features and channels are engaged, while the digital display indicates the currently selected footswitch. When using the Tuner function the digital display shows the closest current note being played, as the LED panel is used to fine tune that note perfectly. All that is required to connect the switching power and functionality of the MG footcontroller is a good quality guitar lead. No more expensive manufacturer cables to repair or replace and an end to the question on all guitarists lips: "Will my footswitch cable reach?" The MG footcontroller puts you back in charge not your footswitch.
